

Being conscious of its role for a responsible growth, Settima Meccanica's perspective is to contribute to the improvement of life and territory quality, by adopting an environmental policy that aims to:

- Maintain the natural balance of all environmental aspects;
- Prevent any type of pollution;
- Protect human health;
- Use accurately and rationally the natural resources;
- Promote measures aimed at improving the environmental performance of the company;
- Minimize the impact of the company activity on the environment, by promoting the adoption of a Life Cycle Assessment (LCA) logic, starting from the planning stages.

The environmental policy represents, for the company, a clear civil commitment as well as an element of stability and efficiency.

Optimizing the environmental impact means institutionalizing, documenting and spreading knowledge of the rules adopted as an organizational and operational reference standard, in relation to all environmental aspects, as well as providing the resources necessary to the implementation of this policy, according to organic planning.

In the process of implementation of its environmental management system, the company has chosen the standard UNI EN ISO 14001: 2015, as universally recognized, and widely applied, ensures the validity of standards, and makes easier to relate to situations external to the company, facilitating comparisons in terms of choices and results.

The implementation of the environmental management system involves:

- defining an organizational structure through which the operating procedures are defined, and tasks and responsibilities are established;
- adapting the system to the evolution of environmental and technical aspects;
- monitoring all processes, identifying and recording every problem and managing deviations from the objectives defined through appropriate corrective actions, of which the implementation and effectiveness will be checked;
- promoting the preventive actions necessary to anticipate the occurrence of deviations from the objectives related to the environmental performance;
- maintaining an adequate level of staff training and education, constantly involving them in the consideration that environmental problems are everyone's problems, and therefore require the participation of each employee to solve them.
- Including Settima's supplier base, with which to promote and implement mutually beneficial processes and procedures, in line with criteria for improvement of the environment;
- maintaining the necessary level of communication with the outside, which allows stakeholders to have figures related to the company's environmental impact;
- carrying out an initial analysis, in order to acquire the knowledge about state-of-the-art, according to which set the system and the related goals;
- referring to indicators related to significant environmental aspects; in relation to these, setting specific objectives and planning the times, responsibilities, resources and operational paths that allow them to be reached; evaluating, by the established deadline, the level of implementation of what has been planned;
- complying scrupulously with the provisions of the current environmental law.
